7. In the circuit shown below, the key is pressed at time $t = 0$. Which of the following statement(s) is(are) true?

- (A*) The voltmeter displays -5 V as soon as the key is pressed, and displays $+5 \text{ V}$ after a long time
 (B*) The voltmeter will display 0 V at time $t = \ln 2$ seconds
 (C*) The current in the ammeter becomes $1/e$ of the initial value after 1 second
 (D*) The current in the ammeter becomes zero after a long time

Ans: [ABCD]

Sol. $q_1 = C_1 V \left(1 - e^{-\frac{t}{R_1 C_1}} \right)$

$$i_1 = \frac{V}{R_1} \left(1 - e^{-\frac{t}{R_1 C_1}} \right)$$

$$q_2 = C_2 V \left(1 - e^{-\frac{t}{R_2 C_2}} \right)$$

$$i_2 = \frac{V}{R_2} \left(1 - e^{-\frac{t}{R_2 C_2}} \right)$$

$$R_1 C_1 = R_2 C_2 = 1$$

8. Consider two identical galvanometers and two identical resistors with resistance R . If the internal resistance of the galvanometers $R_C < R/2$, which of the following statement(s) about any one of the galvanometers is(are) true?

- (A) The maximum voltage range is obtained when all the components are connected in series.
 (B*) The maximum voltage range is obtained when the two resistors and one galvanometer are connected in series, and the second galvanometer is connected in parallel to the first galvanometer
 (C*) The maximum current range is obtained when all the components are connected in parallel
 (D) The maximum current range is obtained when the two galvanometers are connected in series and the combination is connected in parallel with both the resistors.

Ans: [BC]

Sol.

$$V_A = i_g (2R + 2R_C)$$

$$V_B = 2i_g \times 2R + i_g \times R_C$$

$$= i_g (4R + R_C)$$

$$\text{Suppose } V_A > V_B$$

$$i_g(2R + 2R_C) > i_g(4R + R_C)$$

$$2R + 2R_C > 4R + R_C$$

$$R_C > 2R$$

$$\text{but } R_C < \frac{R}{2} \text{ (given in question)}$$

So, voltage range is maximum in B.

$$2i_g = i_c \frac{\left(\frac{R}{2}\right)}{\left(\frac{R_c}{2} + \frac{R}{2}\right)} = \frac{i_c R}{R_c + R}$$

$$i_c = \frac{2(R_c + R)}{R} i_g$$

$$i_g = i_D \times \left(\frac{R/2}{\frac{R}{2} + 2R_c} \right) = i_D \frac{R}{R + 4R_c}$$

$$i_D = \frac{i_g (R + 4R_c)}{R}$$

Let $i_c > i_D$

$$\frac{2(R_c + R)}{R} i_g > \frac{i_g (R + 4R_c)}{R}$$

$$2(R_c + R) > R + 4R_c$$

$$2R_c + 2R > R + 4R_c$$

$$R > 2R_c$$

$$\text{or } R_c < \frac{R}{2}$$

This condition is given in the question. So current range is maximum in C.

$$[TE] = \frac{1}{2}m\omega^2 A^2 = \frac{1}{2}m\left(\frac{k}{m}\right)^2 A^2 = \frac{1}{2}kA^2$$

$$\text{Case II} \quad \frac{1}{2}(M+m)v^2 = \frac{1}{2}kA^2 \Rightarrow v = \sqrt{\frac{k}{M+m}} A^2 = \omega' A$$

$w \downarrow v \downarrow$

The distance between the sources $d = 0.6003$ mm. The origin O is at the intersection of the screen and the line joining S_1S_2 . Which of the following is(are) true of the intensity pattern on the screen?

- (A*) The region very close to the point O will be dark
 (B) Hyperbolic bright and dark bands with foci symmetrically placed about O in the x-direction
 (C) Straight bright and dark bands parallel to the x-axis
 (D*) Semicircular bright and dark bands centered at point O

Ans: [AD]

Sol. at 0

$$\Delta x = d = 0.6003 \times 10^{-3} \text{ m} = n \left(\frac{\lambda}{2} \right)$$

$$n = \frac{0.6003 \times 10^{-3} \times 2}{600 \times 10^{-9}} = \frac{6003}{600} \times 100 \times 2$$

$$= 2001 \text{ (= odd)}$$

Hence dark.

12. In an experiment to determine the acceleration due to gravity g , the formula used for the time period of a periodic motion is $T = 2\pi \sqrt{\frac{7(R-r)}{5g}}$. The values of R and r are measured to be (60 ± 1) mm and (10 ± 1) mm, respectively. In five successive measurements, the time period is found to be 0.52 s, 0.56 s, 0.57 s, 0.54 s and 0.59 s. The least count of the watch used for the measurement of time period is 0.01 s. Which of the following statement(s) is(are) true?
- (A*) The error in the measurement of r is 10%
 (B*) The error in the measurement of T is 3.57%
 (C) The error in the measurement of T is 2%
 (D*) The error in the determined value of g is 11%

Ans. [ABD]

Sol. $T_{\text{avg}} = 55.6$

$$\begin{aligned} \text{Average absolute error} &= \frac{|T_{\text{avg}} - T_1| + |T_{\text{avg}} - T_2| + |T_{\text{avg}} - T_3| + |T_{\text{avg}} - T_4| + |T_{\text{avg}} - T_5|}{5} \\ &= \frac{0.016 + 0.036 + 0.004 + 0.014 + 0.034}{5} = 0.0208 \end{aligned}$$

$\therefore$ Average absolute error measured = 0.0208 > 0.01 = L.C.

Hence ΔT = average absolute error = 0.0208

$$\frac{\Delta T}{T} \times 100$$

$$g = \frac{4\pi^2 7(R-r)}{5T^2}$$

PARAGRAPH-1

A frame of reference that is accelerated with respect to an inertial frame of reference is called a non-inertial frame of reference. A coordinate system fixed on a circular disc rotating about a fixed axis with a constant angular velocity ω is an example of a non-inertial frame of reference.

The relationship between the force $\vec{F}_{\text{rot}}$ experienced by a particle of mass m moving on the rotating disc and the force $\vec{F}_{\text{in}}$ experienced by the particle in an inertial frame of reference is

$$\vec{F}_{\text{rot}} = \vec{F}_{\text{in}} + 2m(\vec{v}_{\text{rot}} \times \vec{\omega}) + m(\vec{\omega} \times \vec{r}) \times \vec{\omega}$$

where $\vec{v}_{\text{rot}}$ is the velocity of the particle in the rotating frame of reference and $\vec{r}$ is the position vector of the particle with respect to the centre of the disc.

Now consider a smooth slot along a diameter of a disc of radius R rotating counter-clockwise with a constant angular speed ω about its vertical axis through its center. We assign a coordinate system with the origin at the center of the disc, the x -axis along the slot, the y -axis perpendicular to the slot and the z -axis along the rotation axis ($\vec{\omega} = \omega\hat{k}$). A small block of mass m is gently placed in the slot at $\vec{r} = (R/2)\hat{i}$ at $t = 0$ and is constrained to move only along the slot.

PARAGRAPH-2

Consider an evacuated cylindrical chamber of height h having rigid conducting plates at the ends and an insulating curved surface as shown in the figure. A number of spherical balls made of a light weight and soft material and coated with a conducting material are placed on the bottom plate. The balls have a radius $r \ll h$. Now a high voltage source (HV) is connected across the conducting plates such that the bottom plate is at $+V_0$ and the top plate at $-V_0$. Due to their conducting surface, the balls will get charged, will become equipotential with the plate and are repelled by it. The balls will eventually collide with the top plate, where the coefficient of restitution can be taken to be zero due to the soft nature of the material of the balls. The electric field in the chamber can be considered to be that of a parallel plate capacitor. Assume that there are no collisions between the balls and the interaction between them is negligible. (Ignore gravity)

Thermal decomposition of gaseous X_2 to gaseous X at 298 K takes place according to the following equation:

The standard reaction Gibbs energy, $\Delta_r G^\circ$, of this reaction is positive. At the start of the reaction, there is one mole of X_2 and no X. As the reaction proceeds, the number of moles of X formed is given by β . Thus, $\beta_{\text{equilibrium}}$ is the number of moles of X formed at equilibrium. The reaction is carried out at a constant total pressure of 2 bar. Consider the gases to behave ideally.

[Given : $R = 0.083 \text{ L bar K}^{-1} \text{ mol}^{-1}$]

33. The equilibrium constant K_p for this reaction at 298 K, in terms of $\beta_{\text{equilibrium}}$, is

- (A) $\frac{8\beta_{\text{equilibrium}}^2}{2 - \beta_{\text{equilibrium}}}$ (B) $\frac{8\beta_{\text{equilibrium}}^2}{4 - \beta_{\text{equilibrium}}^2}$ (C) $\frac{4\beta_{\text{equilibrium}}^2}{2 - \beta_{\text{equilibrium}}}$ (D) $\frac{4\beta_{\text{equilibrium}}^2}{4 - \beta_{\text{equilibrium}}^2}$

Ans. [B]

Sol. $\Delta G^\circ > 0$

$t = 0$ 1 mol

$t = t$ $\left(\frac{1-\alpha}{1+\alpha}\right) \times 2$ $\left(\frac{2\alpha}{1+\alpha}\right) \times 2$

$$K_p = \frac{\left(\frac{2\alpha}{1+\alpha}\right)^2 \times 4}{\left(\frac{1-\alpha}{1+\alpha}\right) \times 2} = \frac{8\alpha^2}{1-\alpha^2}$$

$$2\alpha = \beta_{\text{equilibrium}}$$

$$K_p = \frac{8\left(\frac{\beta}{2}\right)^2}{1 - \left(\frac{\beta}{2}\right)^2} \Rightarrow \left(\frac{8\beta_{\text{equilibrium}}^2}{4 - \beta_{\text{equilibrium}}^2}\right)$$

34. The **INCORRECT** statement among the following, for this reaction, is
- (A) Decrease in the total pressure will result in formation of more moles of gaseous X
- (B) At the start of the reaction, dissociation of gaseous X_2 takes place spontaneously
- (C) $\beta_{\text{equilibrium}} = 0.7$
- (D) $K_C < 1$

Ans. [C]

Sol. For (A) option :

$Q_P \propto P_{\text{total}}$ so on decreasing P_{Total} , Q_P decreases so reaction shift toward forward direction and form more moles of $X(g)$

For (B) option :

$$\Delta G = \Delta G^\circ + RT \ln Q_P$$

At the start, $Q_P \rightarrow 0$

$$\Delta G = \Delta G^\circ > 0, \text{ non spontaneous}$$

For (C) option :

If $\beta_{\text{equilibrium}} = 0.7$

$$K_P = \left[\frac{8 \times (0.7)^2}{4 - (0.7)^2} \right] \approx 1.11$$

$K_P > 1$, **C is incorrect**

For (D) option :

$$\Delta n_g = +1$$

$$\Delta G^\circ = -RT \ln K_P = +ve$$

$$\ln K_P < 0 \Rightarrow K_P < 1$$

$$K_P = K_C (RT)^{\Delta n_g}$$

$$K_P = K_C (RT)$$

$$K_C = \frac{K_P}{RT} < 1$$

Sol. $C : x^2 + y^2 - 4x - 16y + 64 = 0$

$C(2, 8)$

$r = \sqrt{4 + 64 - 64} = 2$

$y = mx - 2m - m^3$

 (C) **NOT** differentiable at $x = 0$ if $a = 1$ and $b = 0$
 (D) **NOT** differentiable at $x = 1$ if $a = 1$ and $b = 1$

Sol. $a \cos(|x^3 - x|) + b|x| \sin(|x^3 + x|)$

$$\underbrace{a \cos(x^3 - x)}_{\text{Deri}} + b|x| \sin(|x|(x^2 + 1))$$

$$|x| \sin(|x|(x^2 + 1)) = \begin{cases} x \sin(x^3 + x), & x \geq 0 \\ +x \sin(x^3 + x), & x < 0 \end{cases}$$

Suppose $f'(2) = g(2) = 0$, $f''(2) \neq 0$ and $g'(2) \neq 0$. If $\lim_{x \rightarrow 2} \frac{f(x)g(x)}{f'(x)g'(x)} = 1$, then

- (A) f has a local minimum at $x = 2$
 (B) f has a local maximum at $x = 2$
 (C) $f''(2) > f(2)$
 (D) $f(x) - f''(x) = 0$ for at least one $x \in \mathbb{R}$

 (C) If $\lambda + \mu = 0$, then the system has infinitely many solutions for $a = -3$.
 (D) If $\lambda + \mu \neq 0$, then the system has no solution for $a = -3$.

Ans. [BCD]

Sol. $ax + 2y = \lambda$

$$3x - 2y = \mu$$

- (i) If $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$ the infinite solution

Football teams T_1 and T_2 have to play two games against each other. It is assumed that the outcomes of the two games are independent. The probabilities of T_1 winning, drawing and losing a game against T_2 are $\frac{1}{2}, \frac{1}{6}$ and $\frac{1}{3}$ respectively. Each team gets 3 points for a win, 1 point for a draw and 0 point for a loss in a game. Let X and Y denote the total points scored by teams T_1 and T_2 respectively, after two games.

51. $P(X > Y)$ is

- (A) $\frac{1}{4}$ (B) $\frac{5}{12}$ (C) $\frac{1}{2}$ (D) $\frac{7}{12}$

Ans. [B]

52. $P(X = Y)$ is

- (A) $\frac{11}{36}$ (B) $\frac{1}{3}$ (C) $\frac{13}{36}$ (D) $\frac{1}{2}$

Ans. [C]

Sol.

$$(i) \quad P(X > Y) = \frac{1}{2} \left(\frac{1}{2} + \frac{1}{6} \right) + \frac{1}{6} \times \frac{1}{2} = \frac{1}{4} + \frac{1}{12} = \frac{5}{12}$$

$$(ii) \quad P(X = Y) = \frac{1}{2} \times \frac{1}{3} + \frac{1}{3} \times \frac{1}{2} + \frac{1}{6} \times \frac{1}{6} = \frac{6+6+1}{36} = \frac{13}{36}$$

PARAGRAPH-2

Let $F_1(x_1, 0)$ and $F_2(x_2, 0)$, for $x_1 < 0$ and $x_2 > 0$, be the foci of the ellipse $\frac{x^2}{9} + \frac{y^2}{8} = 1$. Suppose a parabola having vertex at the origin and focus at F_2 intersect the ellipse at point M in the first quadrant and at point N in the fourth quadrant.

53. The orthocentre of the triangle F_1MN is

- (A) $\left(\frac{-9}{10}, 0\right)$ (B) $\left(\frac{2}{3}, 0\right)$ (C) $\left(\frac{9}{10}, 0\right)$ (D) $\left(\frac{2}{3}, \sqrt{6}\right)$

Ans. [A]

11. If the tangents to the ellipse at M and N meet at R and the normal to the parabola at M meets the x-axis at Q, then the ratio of area of the triangle MQR to area of the quadrilateral MF_1NF_2 is

- (A) 3 : 4 (B) 4 : 5 (C) 5 : 8 (D) 2 : 3

Ans. [C]

Sol.

(i) $a^2 = 9, b^2 = 8$

$$e = \sqrt{1 - \frac{b^2}{a^2}} = \frac{1}{3}$$

Point of intersection of parabola & ellipse $\frac{x^2}{9} + \frac{4x}{8} = 1$

$$\Rightarrow \frac{x^2}{9} + \frac{x}{2} = 1 \Rightarrow 2x^2 + 9x - 18 = 0$$

$$\Rightarrow 2x^2 + 12x - 3x - 18 = 0 \Rightarrow (x + 6)(2x - 3) = 0$$

$$\Rightarrow x = \frac{3}{2} \quad (\because x > 0)$$

$$M = \left(\frac{3}{2}, \sqrt{6}\right), N = \left(\frac{3}{2}, -\sqrt{6}\right)$$

$$\text{Slope of } F_1N = \frac{-\sqrt{6}}{\frac{5}{2}} = \frac{-2\sqrt{6}}{5}$$

$$\text{Equation of altitude through M} \Rightarrow y - \sqrt{6} = \frac{5}{2\sqrt{6}} \left(x - \frac{3}{2}\right)$$

Putting $y = 0$

$$\frac{-12}{5} = x - \frac{3}{2} \Rightarrow x = \frac{3}{2} - \frac{12}{5} \Rightarrow x = \frac{-9}{10}$$

(ii) Tangents to ellipse:

$$\text{at } M \Rightarrow \frac{x}{9} \cdot \frac{3}{2} + \frac{y\sqrt{6}}{8} = 1$$

$$\text{at } N \Rightarrow \frac{x}{9} \cdot \frac{3}{2} - \frac{y\sqrt{6}}{8} = 1$$

$$x = 6, y = 0, R(6, 0)$$

Normal to P.B. at M $\Rightarrow$

$$y - \sqrt{6} = -\frac{\sqrt{6}}{2} \left(x - \frac{3}{2} \right)$$

Putting $y = 0$

$$x - \frac{3}{2} = 2 \Rightarrow x = \frac{7}{2}$$

$$\therefore Q = \left(\frac{7}{2}, 0 \right)$$

$$\text{Area of } \triangle MQR = \frac{1}{2} \times \left(6 - \frac{7}{2} \right) \times \sqrt{6} = \frac{5\sqrt{6}}{4}$$

$$\text{Area of quadrilateral } F_1MF_2N = 2 \times \left(\frac{1}{2} \times 2 \times \sqrt{6} \right) = 2\sqrt{6}$$

$$\therefore \text{ratio} = \frac{\frac{5\sqrt{6}}{4}}{2\sqrt{6}} = \frac{5}{8}$$
